About Big Data Pipelines

SEE A DEMO

Since Python connects to any database, it's easy to empower business users with Dash apps that connect to your databases, query data, perform advanced analytics in Python, and even write back results. As the world's fastest growing language, every database vendor offers a Python connector library (see table below). That's great news for Dash users building analytics apps that connect to databases.

For example, your Dash app might connect to a Snowflake database with Python's Snowflake connector, read customer reviews, perform NLP sentiment analysis, then email a PDF report with [Snapshot Engine](#).

Dash Enterprise ships with battle-tested, plug-and-play Dash app demos for connecting to **Snowflake, Databricks, Postgres, Redis, BigQuery, Salesforce, and Redshift**. These demos show best practices for connecting and querying databases in Python. Scroll below to demo Python Dash apps that connect to today's most back-end popular databases.

Connector Templates

Dash Enterprise ships with plug & play Dash app templates for connecting to these and other data services in Python. These templates demonstrate best practices such as:

[https://plotly.com/dash/big-data-for-python/?utm\\_medium=dash\\_docs&utm\\_content=sidebar&\\_gl=1\\*13q6xtu\\*\\_gcl\\_au\\*NzY3MDkzNTIwLjE3NTIwM...](https://plotly.com/dash/big-data-for-python/?utm_medium=dash_docs&utm_content=sidebar&_gl=1*13q6xtu*_gcl_au*NzY3MDkzNTIwLjE3NTIwM...) 1/6

- Connection pooling
- Preventing SQL injection attacks
- Reading SQL query results into Pandas dataframes
- Secure database authentication with the Dash Enterprise [Secrets Manager](#)

We are not speaking just about reports/dashboards. Dash helps us to organize and combine our data and make it available for a wider spectrum of colleagues, who may require in the future some kind of interaction, such as running finite element simulations for specific parameter combinations.

Senior Simulation Engineer at High-Performance  
Automobile Manufacturer

Connect your Dash apps to all major data warehouses.

- Python, R, and Julia supports best-in-class, open-source connection libraries for Snowflake, Amazon Redshift, IBM DB2, Google BigQuery, PostgreSQL, and Azure SQL Data Warehouse, making it simple to connect these data services to your Dash apps. Dash Enterprise comes with connection examples for each of these data warehouses, so you can easily copy/paste the code into your own Dash apps.
- Use Pandas dataframes in [Data Science Workspaces](#) or your Dash application code to rapidly filter and visualize data warehouse query results.
- Use the Dash Enterprise [Job Queue](#) to sideline long-running data warehouse queries and accelerate your Dash application performance.

Python connects to any database.

This makes it simple to connect your Dash apps to any database, perform AI & ML routines in Python on the data, then deliver these insights to business users as Dash apps.

Database	Python connector library name	Python library downloads per month	Installation command	Dash app example	Documentation
